

Setting up your templates

Adding your own templates

1. Delete The existing templates.

If you don't want them, delete the existing templates.

You will find them in the 'templates' folder. These are the files with a .tpl extent. Also, if GenScriber has been run previously, delete the tmp folder.

2. Start GenScriber.

3. Turn off template protection.

If you are not using admin mode 3, simply unselect the 'Template Protection' option. This will allow you to make modifications to master templates.

Admin mode 3 is only needed if you are creating condition scripts.

4. Create your templates.

To create a template, a worksheet has to be opened. Either open an existing csv file, or create a new document. The worksheet content is of no importance. The column titles are all that matters.

5. In Column Options, select the Advanced Options.

This will activate all advanced options for the worksheet.

6. Make any changes to the worksheet.

The following options can be set and will be saved in the template:

- * Column Title and position.
- * Visibility
- * Width
- * Picklist
- * AutoInc
- * AutoFill
- * AutoRepeat
- * AutoCase
- * Hint
- * Predefined Lists
- * Max Chars

7. From the 'Tools' menu click 'Save Master Template'

The template id is the internal name of the template. this will be used as a reference to the template. The filename, which must have a .tpl extent is of course, the name the template file will be saved by. Remember, it will be displayed in the template menu later, so use a name that describes the template, not the worksheet.

8. Repeat from 4. until all your templates are created.

9. Quit GenScriber

If you set admin mode, GenScriber will ask if you want to reset the ini file. Click **'Yes'**
